Composite manufacturing, right first time

flash comp

Flawless and sustainable production of composite parts
through a human centred digital approach

Fernando Silva

EFFRA – 07/05/2024

General Data

Starting Date: 1st October 2022

Duration: 42 months (30th March 2026)

Project Budget: 6,69 M€

Funding: 5,61 M€

14 partners

Context

- Transition towards **climate neutrality**: need to reduce manufacturing waste
- Composites play an important role In **EU manufacturing**: energy, naval, aerospace sectors...
- Manufacturing of these parts largely based on **manual operations** (difficult to control)
- Current processes: **unsustainable and inefficient** (excess of material, need of reparation...)
- Considerable **environmental impact** (135.000 to 372.000 Tones/year in Liquid resin process)

flash  comp

Project Video

Goal of the Project

- The main objective of FLASH-COMP is to develop a **fast and reliable (FLASH) human-oriented quality control solution** capable of identifying in a timely-manner defectiveness during process and, consequently, to determine the in-situ corrective actions to be implemented.
- Application field will be **composites**, specifically **Liquid Resin Infusion (LRI)** processes, with the objective of reaching the **zero-defects** paradigm thus significantly reducing the generation of polymer composites waste.

LRI Process Steps

Use Cases

AERONAUTICAL SECTOR: IAI

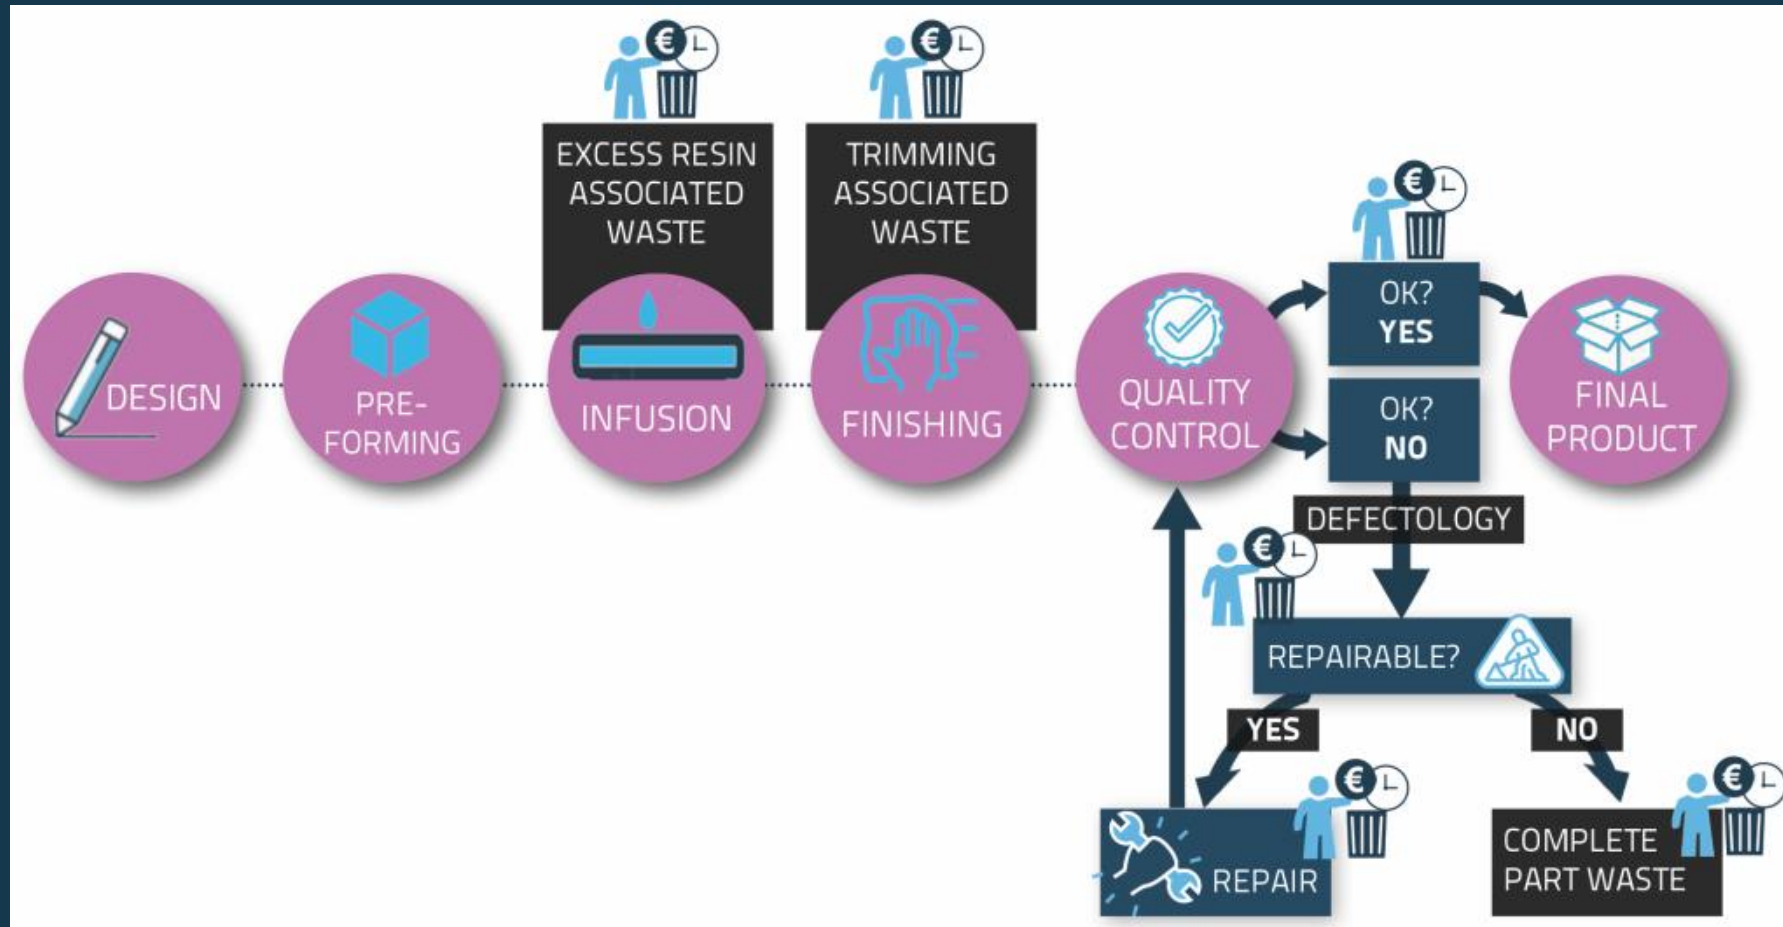

- ⚡ **Aircraft structures** manufacturing: wing skin
- ⚡ Annual Production: 72 wings per year
- ⚡ **Expected savings:**
 - 30 % reduction resin waste,
 - 100 % reduction in discarded spars and wingboxes

NAVAL SECTOR: AZIMUT

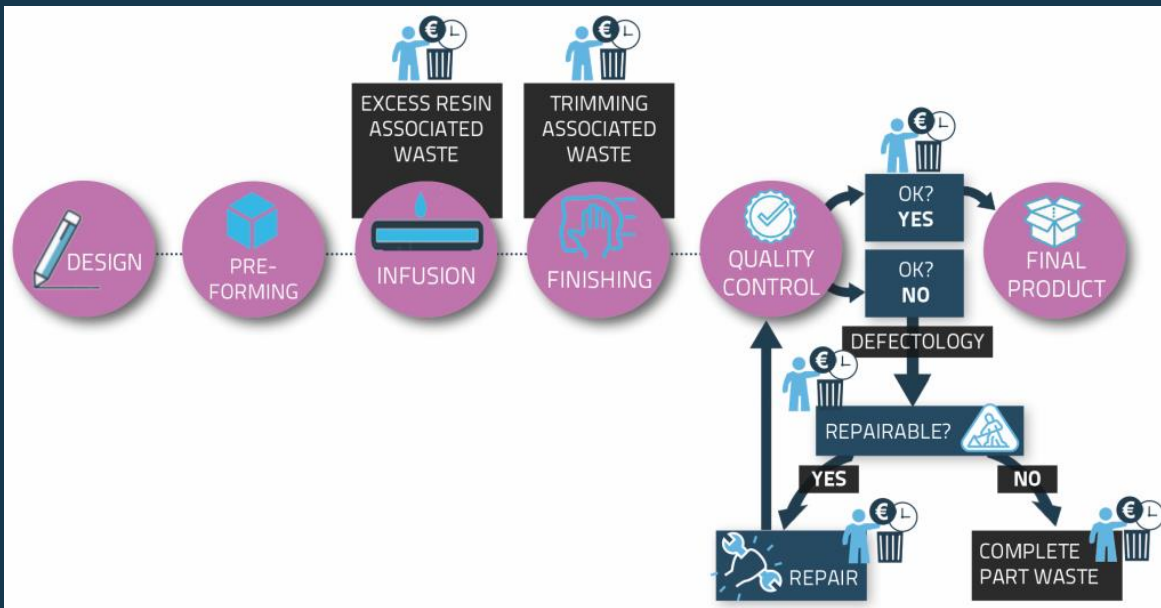

- ⚡ **Yacht manufacturing** composite: 14-50 m in length
- ⚡ Annual Production: 250 yachts, 1400 big components
- ⚡ **Expected savings:**
 - 30 % resin waste,
 - 20 % repairing materials
 - 808 MWh energy consumption

Current LRI Process

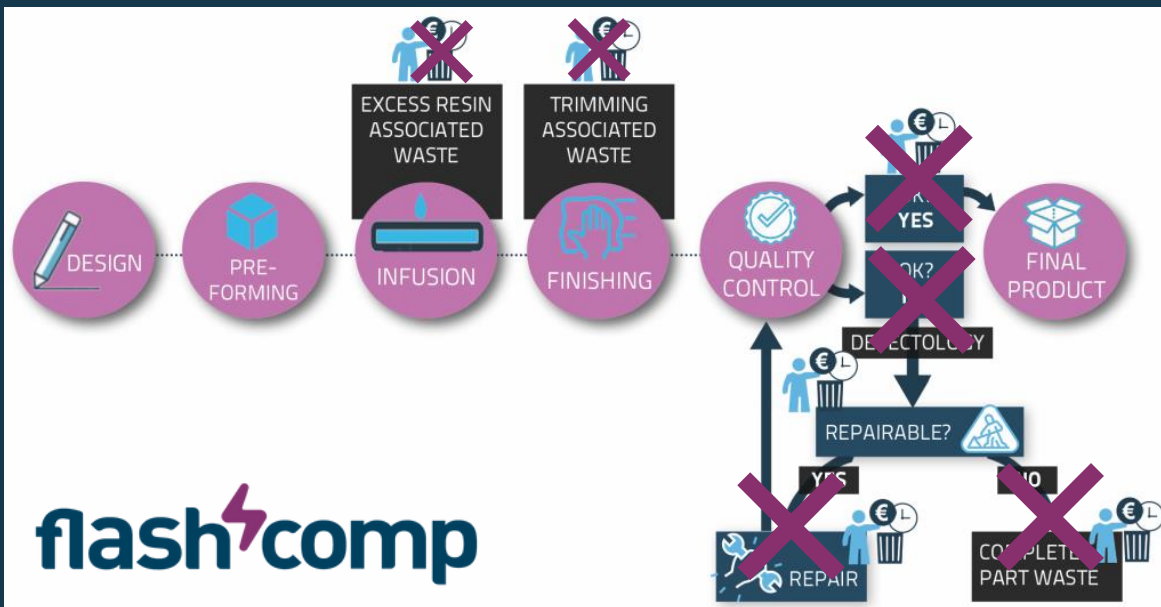

Current LRI Process

- ⚡ Defectiveness occurs (mainly) due to issues in the Pre-Forming and Infusion stages.
- ⚡ Difficult to act over the Infusion process during production.
- ⚡ Feasible defectiveness (voids, dry zones) is avoided by introducing resin in excess:
 - waste within the Infusion and Finishing process
 - complex and expensive quality control loop after the part is finished
- ⚡ Possible to reduce costs from waste and the quality control loop by “simply” establishing corrective actions over the resin-infusion stage.

Flash-Comp Concept

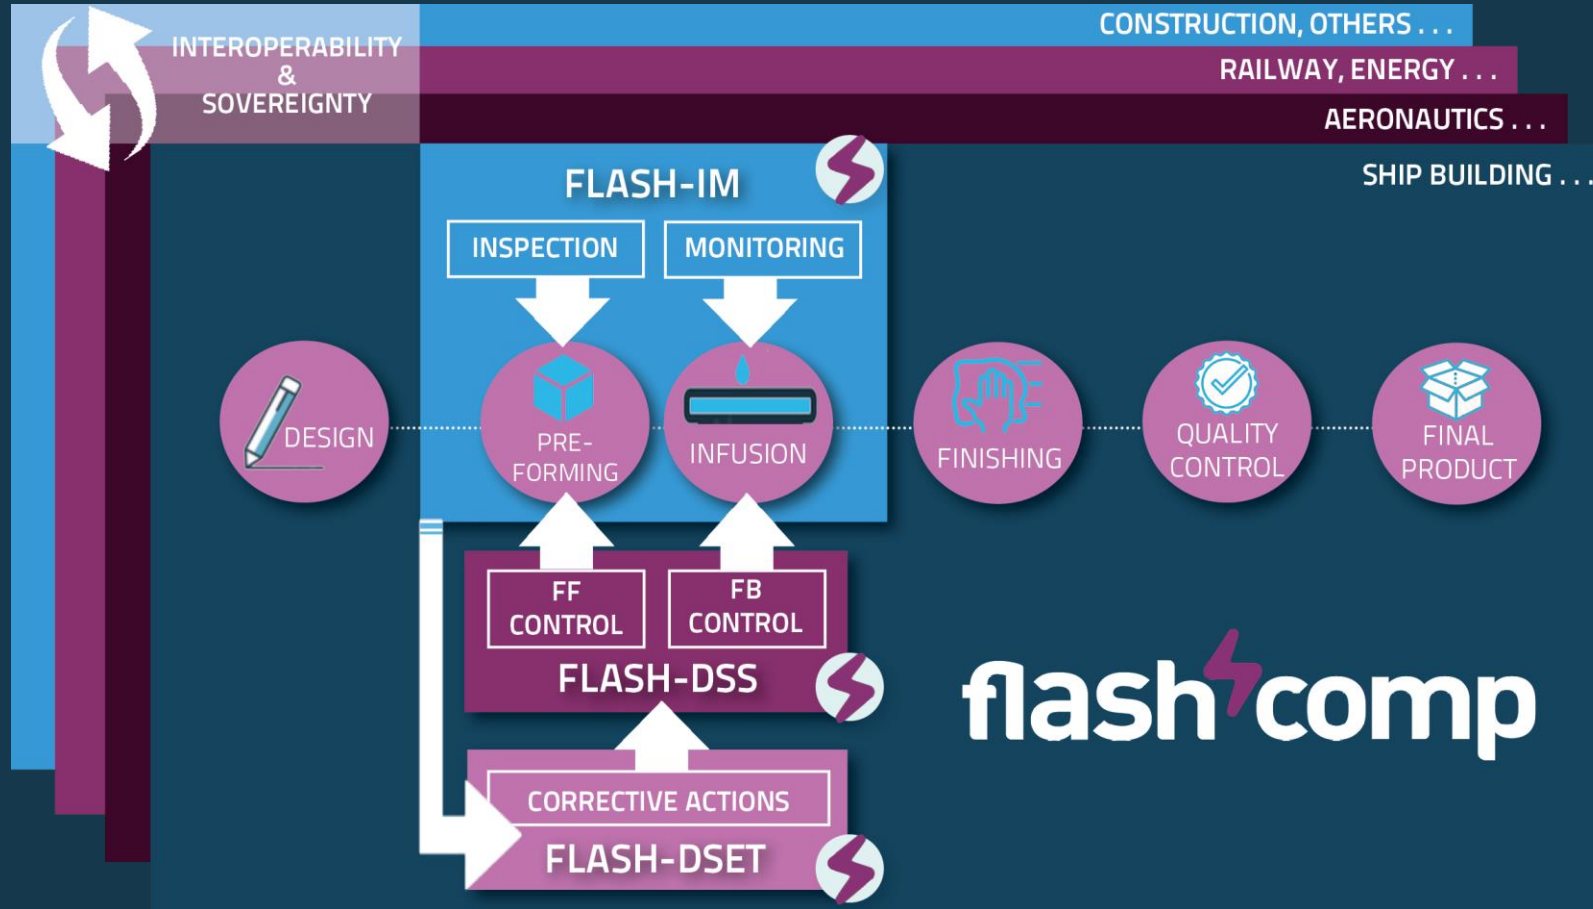

⚡ Quality control and repairing are substituted by corrective actions that take place within the production process

⚡ Corrective actions within the Infusion stage will allow:

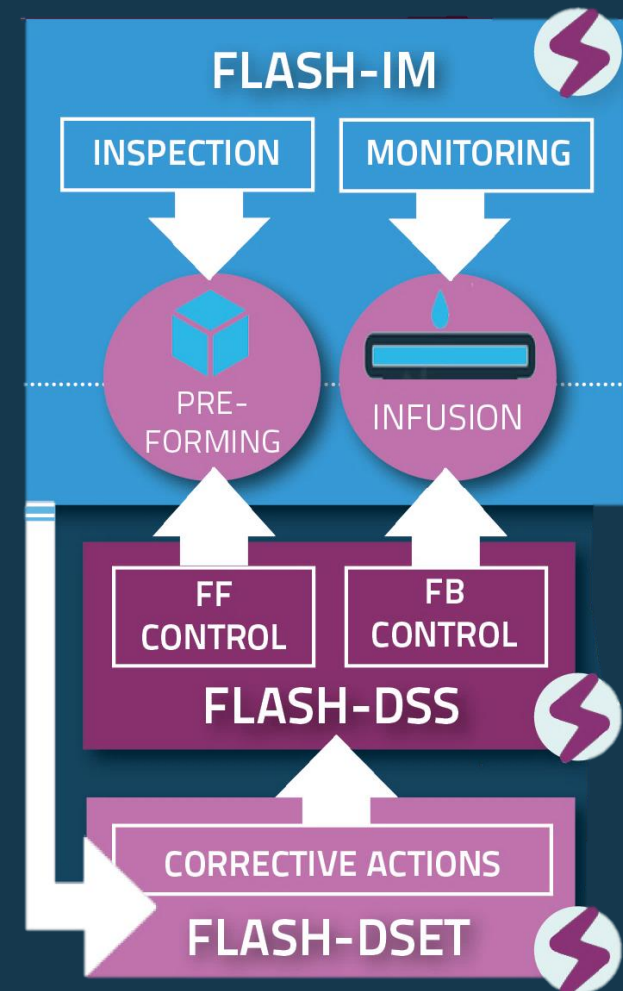

- Manufacturing with **no defects**.
- **Reducing** excess resin and trimming associated **waste**.
- Eliminating the Quality Control stage.
- Producing “**right-first-time**” products.

Flash-Comp Concept

Flash-Comp Concept

- ⚡ **FLASH-IM:** FLASH-COMP will employ novel, fast and accurate **Inspection and Monitoring techniques** within the most critical manufacturing stages (Pre-Forming and Infusion), to retrieve key process parameters.
- ⚡ **FLASH-DSET:** This data will feed an **AI-based Defect Severity Estimation Tool**, capable of estimating the generation of defects and, in consequence, determining if and what kind of corrective actions should be adopted.
- ⚡ **FLASH-DSS:** Instructions will be linked to **real-time feedforward and feedback (FF/FB) control strategy Decision Support System**.
The solution will **increase its knowledge** by sharing **interoperable and sovereign data** among different **sites and factories**.

Flash-IM | Monitoring Technologies

Hyperspectral Camera

Matrix/Linear Camera

LiDAR

Perfilometer

Pyzoflex Sensors

Fibre Optic Sensors

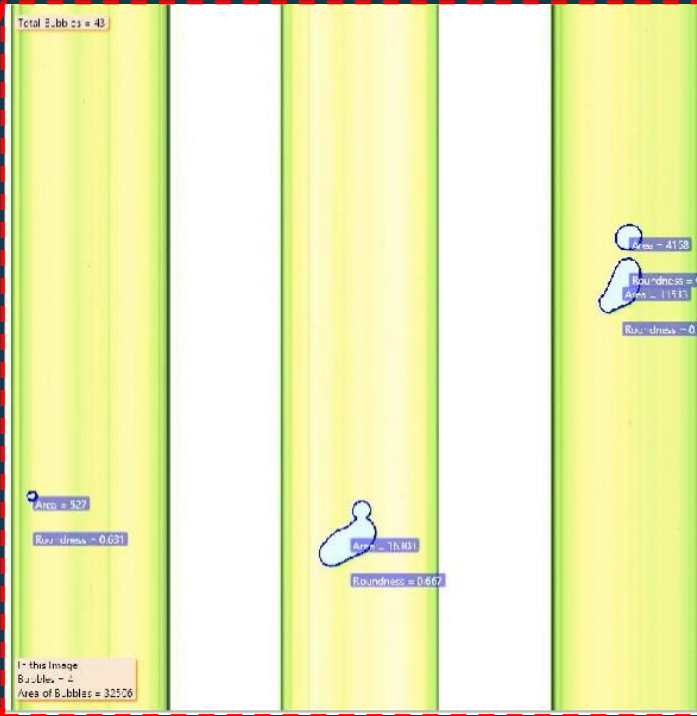

Matrix/Linear Camera

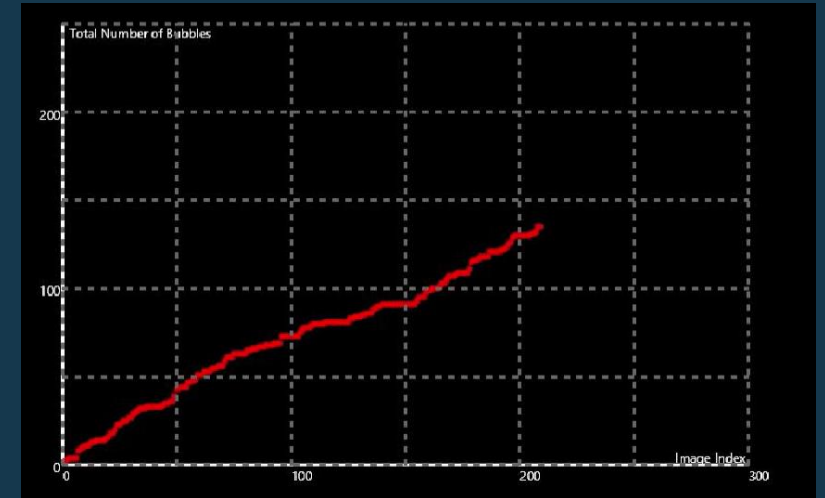

AR

Flash-IM | Bubble Counting

Bubble Count and Plotting

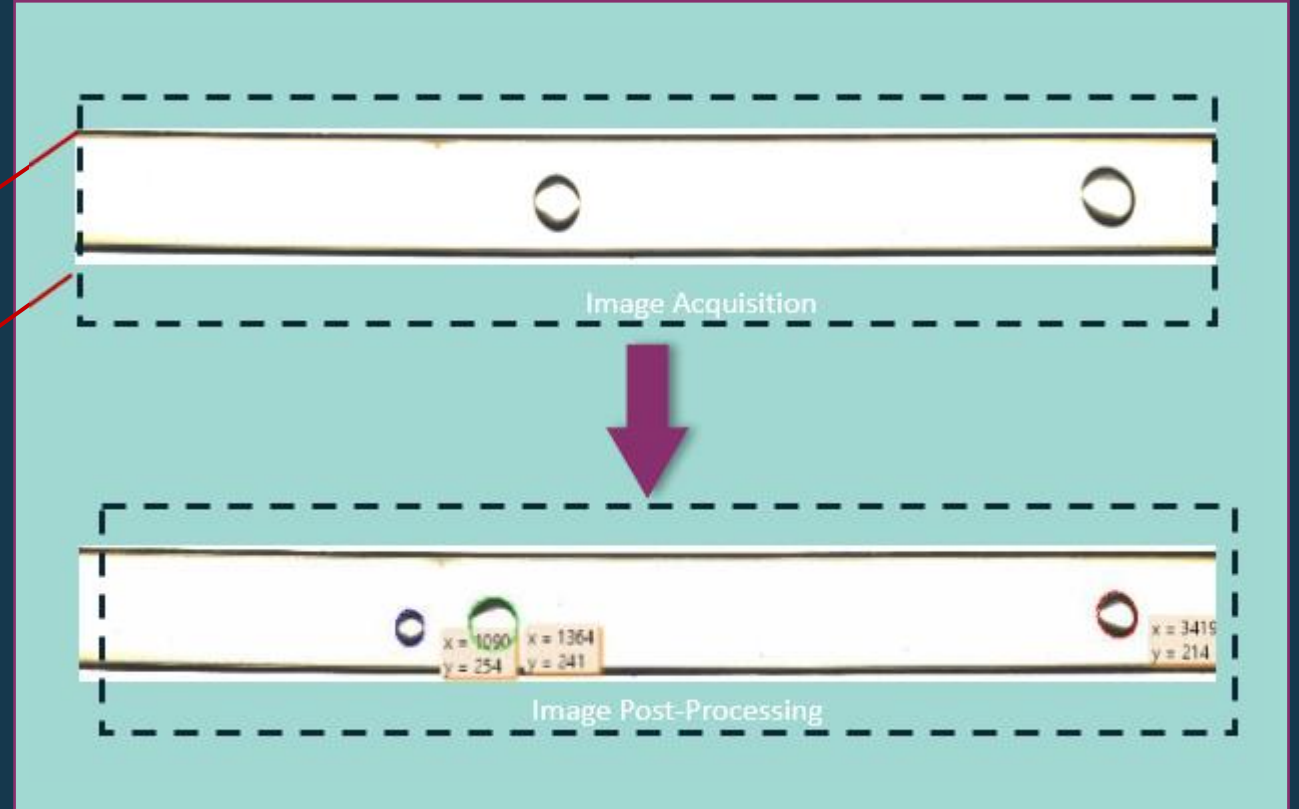

Objective: Monitoring of resin transport tubes, to check for air ingress into the laminate.

Matrix/Linear Camera

Flash-IM | Bubble Tracking

Objective: Monitoring of bubble velocity and size to calculate the flow of injected resin and air.

Matrix/Linear Camera

AR

Flash-IM | Skincoat Curing

First Frame

Last Frame

Lack of Impregnation

Correct Impregnation

Excessive Impregnation

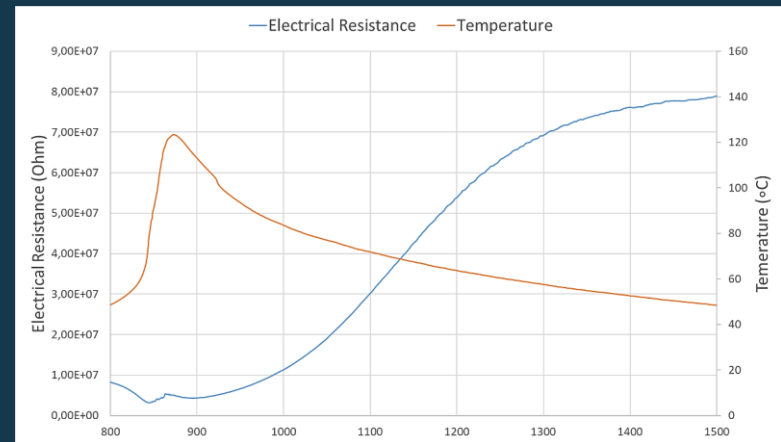

⚡ The **colour** of the images acquired is correlated with the **level of impregnation** of the laminate

Flash-IM | Gelcoat Curing

Matrix/Linear Camera

AR

⚡ **Principal Component Analysis (PCA)** on Image subtraction result

Typical Curing Evolution

Matrix/Linear Camera

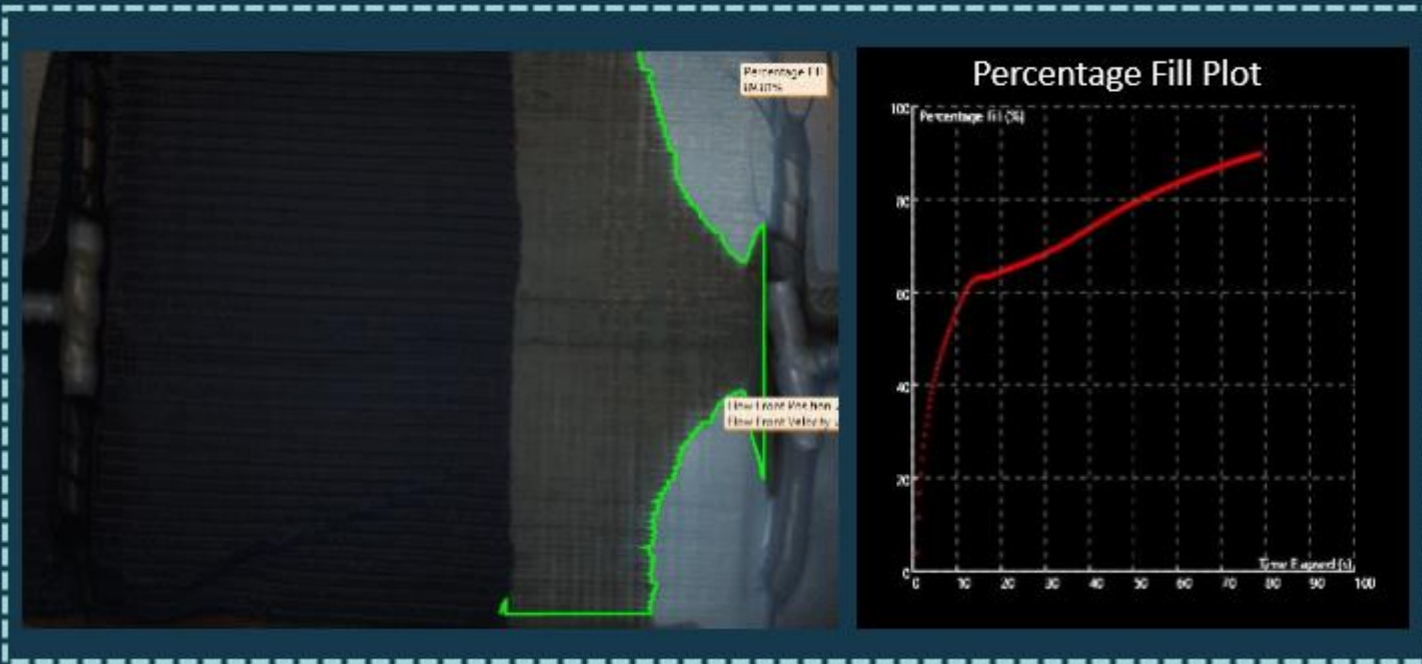

AR

Flash-IM | Flow Front Monitoring

Permeability Changes

Obstacles on ROI (Tubes and pleats)

⚡ The flow front pattern/position is one of the most important process parameters, since its assessment can help prevent the most severe defects that may occur during infusion.

Flash-IM | Core Placement

Matrix/Linear Camera

Disparity Image

Cameras Pose

LiDAR

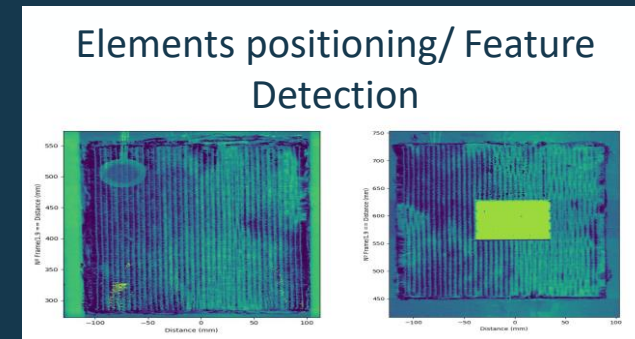

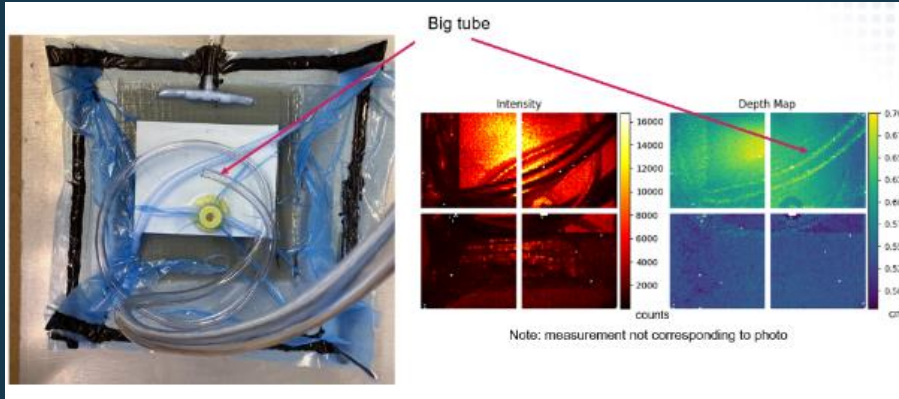

Flash-IM | Infusion Features Detection

Perfilometer

LiDAR

Perfilometer

- ⚡ Integration of new laser (low FWHM and multi pulse feature) enhance precision to 0.58 cm

Matrix/Linear Camera

LiDAR

Perfilometer

Flash-IM | Infusion Features Detection

3D MODEL

- Pleats
- Inlets/Outlets
- Pipes
- Clean Areas

Flash-IM | Binder Application

Hyperspectral Images (False Color) - NIR

Glass fiber (CSM)

Gfiber (CSM) with binder

- ⚡ Different Materials
- ⚡ Features
- ⚡ Defects

PCA

PCA analysis:

- ⚡ Good discrimination between the spectra of the **fiber** and the spectra of the fiber with **binder**.

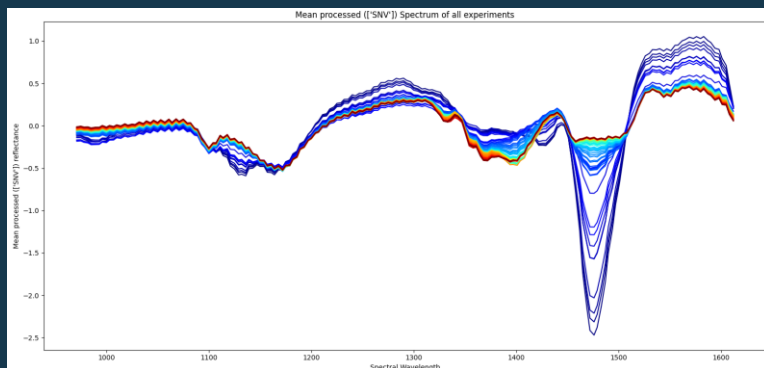

Hyperspectral Camera

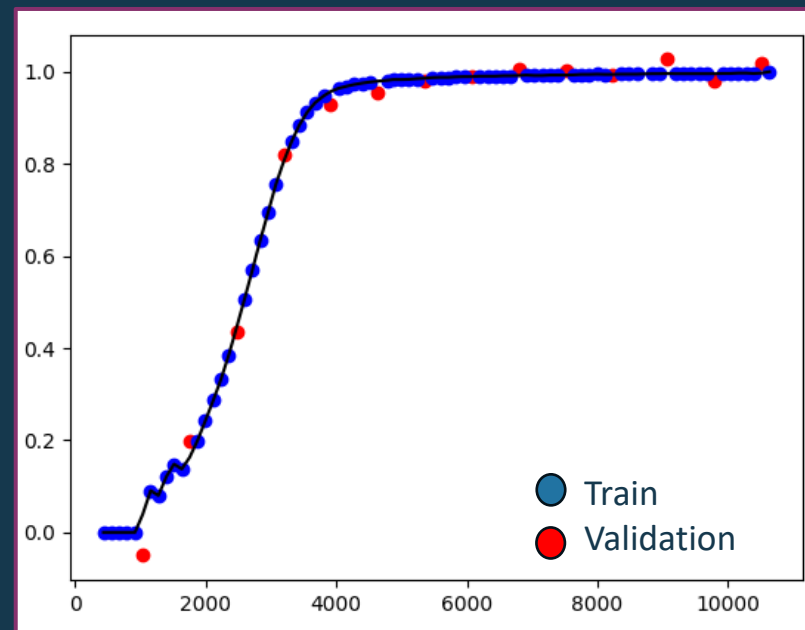

Near Camera

Flash-IM | Resin Curing Degree

Pre-processed reflectance mean data of each acquisition

PLS-Regression

Dielectric sensor data as ground truth for regression model

⚡ Good fit between dielectric and spectral results

Fibre Optic Sensors

Sensors

Flash-IM | Process Variables

Fibre inserted into Laminate

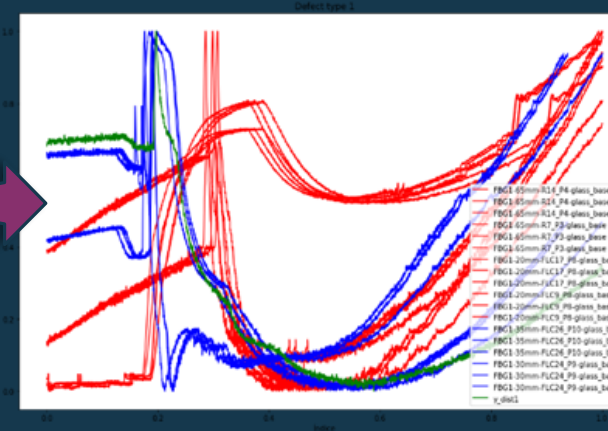

Fiber Bragg Grating (FBG)

During Preforming

- ⚡ Pressure
- ⚡ Leaks
- ⚡ Temperature

All Grating Fiber

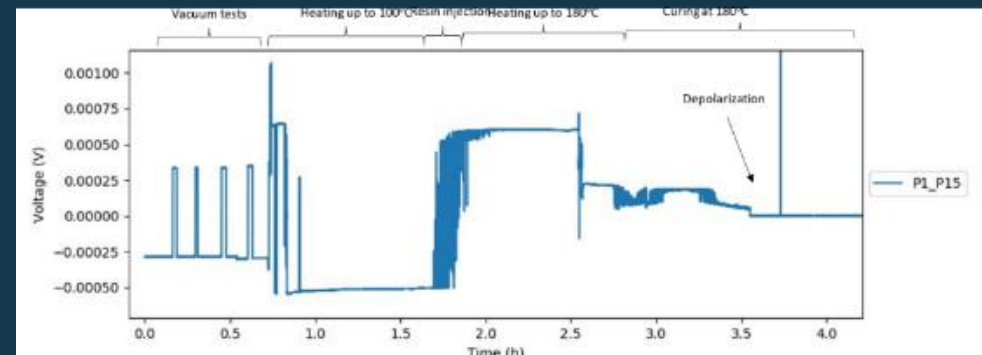

During Infusion

- ⚡ Flow Front Position
- ⚡ Temperature
- ⚡ Pressure

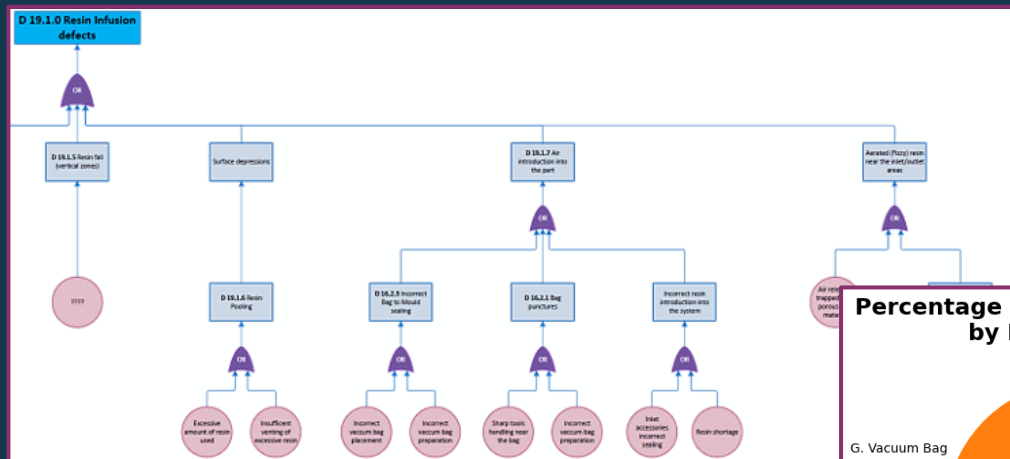

Pyzoflex Sensors

Flash-IM | Process Variables

Pressure Monitoring

Flash-DSET | FMEA

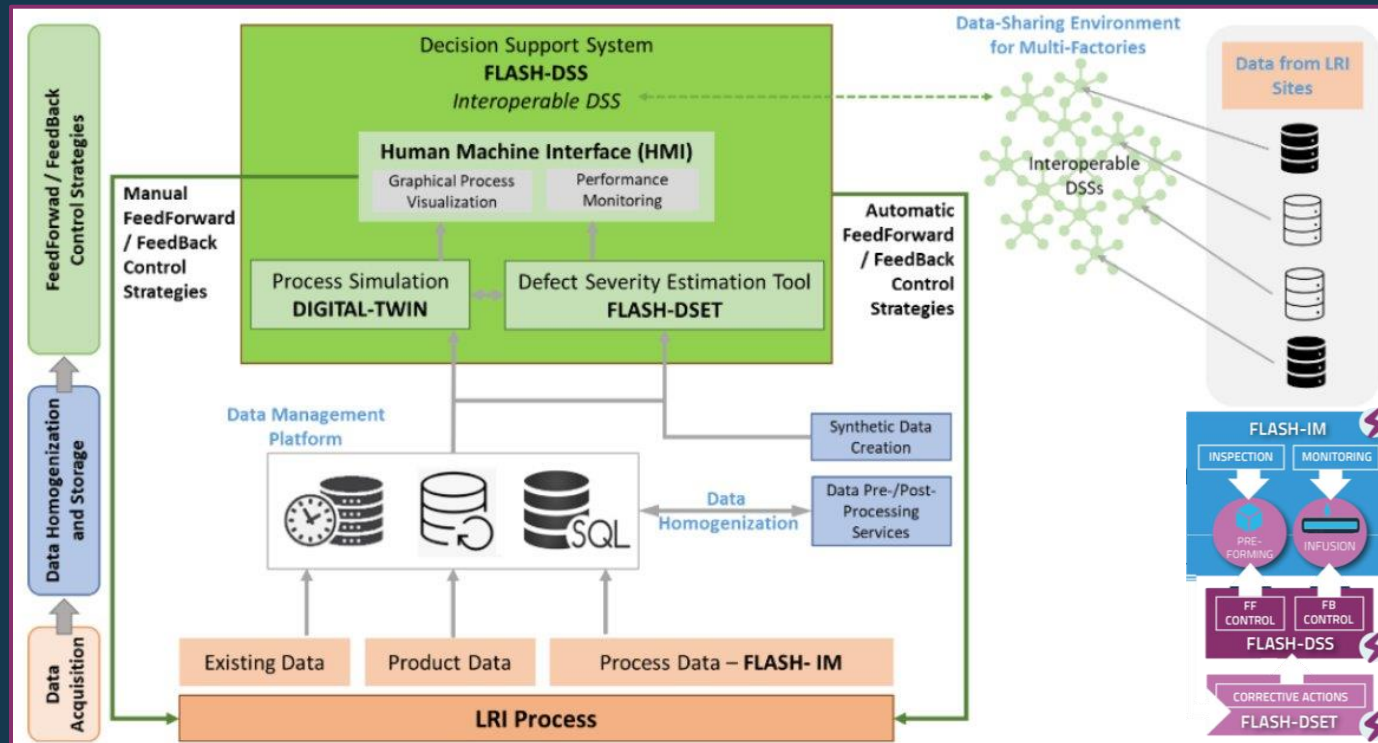

Percentage of highest RPN defects by Process Phase

⚡ FMEA process steps:

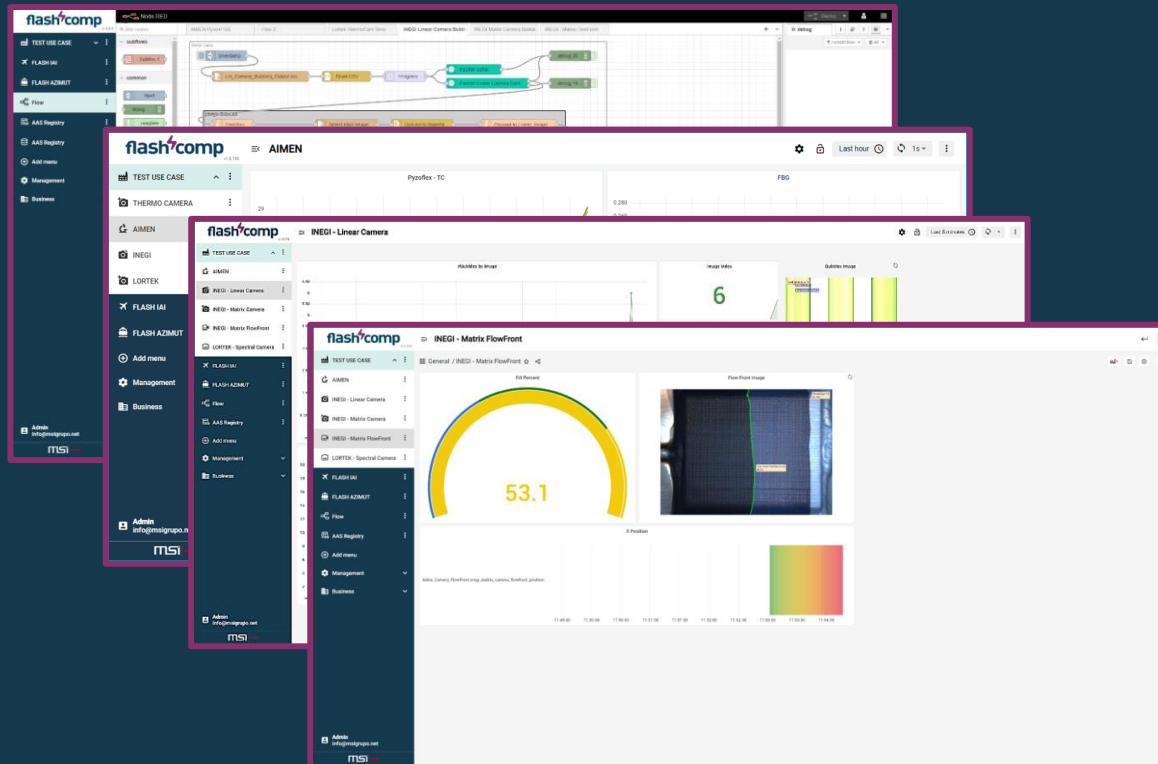

- Identify **Modes of failure**.
- Identify **Consequences**
- Rate the **Severity (S)**
- Identify the potential **Root Causes**
- Rate the probability of **Occurrence**
- Identify **Process controls and Indicators**.
- Rate **Detectability (D)**
- Calculate **Risk Priority Number (RPN)** and **Criticality**.
- Mitigate **High-risk** or **Highly critical failures**

Flash-DSS | Interoperability

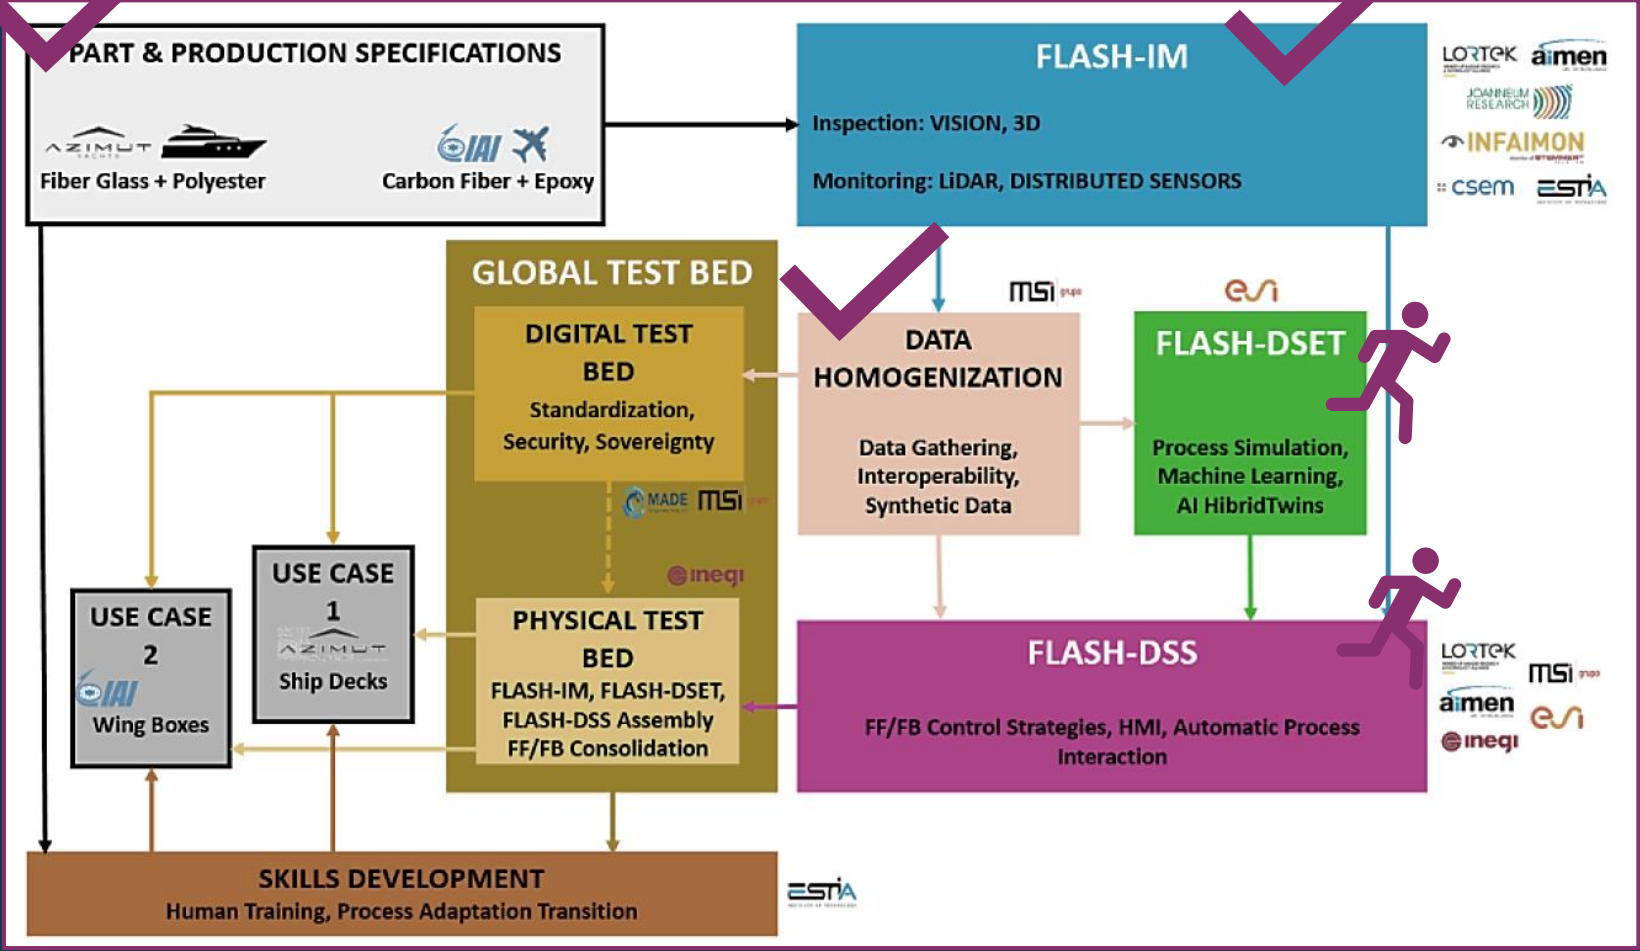

- ⚡ Ingest and process FLASH-IM Data
- ⚡ Digital Twin of the process
- ⚡ Decision Support System (DSS)
- ⚡ User Interface (HMI)
- ⚡ Defect Severity Estimation Tool
- ⚡ FB/FF Control strategies
- ⚡ Data Governance
- ⚡ Synthetic data creation

Flash-DSS | Digital Platform

- ⚡ Display Realtime data of the process
- ⚡ Help the operator to make **decisions**
- ⚡ User friendly Interface

Next Steps
